

Future role of gas

Questions and dilemmas – but no answers....

D.A. Leonov

Head of Directorate PJSC , Ph.D.

24th meeting of the EU-Russia Gas Advisory Council's

Work Stream on Internal Market Issues,

Vienna, European Commission Representation in Austria, 01.12.2017

Questions and dilemmas...

- How the European gas sector will look like in 3-5 years' time? Will it experience some major changes in regulation or minor corrections?

Will competition between gas exporters disappear and transform to competition between endogenous EU stakeholders?

- How reliable “new sources” of energy can be in European energy matrix (primary energy balance) in long-term horizon?

- Can natural gas be an energy source of last resort in case of an unexpected growth in energy demand in the EU?

What needs to be done – maybe it is the time to change end-users attitude to gas?

Increment of gas demand volatility caused by temperature variations – who and how in the EU will cover such fluctuations?

- Is there in the EU any scientifically based studies which evaluate evolution of Energy matrix (primary energy balance) in long-term horizon from the point of Sustainable Development Goals? Which fuel will be the bridge to the sustainable world?

- Which actions needed to be done to achieve COP-21 targets: politically based or economically rational, or both of it are not quite enough?

THANK YOU FOR YOUR ATTENTION!
